Anton Johansson

Analysis & market

anton.johansson@svenskvindenergi.org

Executive Summary Q3 2024

- No turbine orders in the third quarter, but previous investment decisions mean that the expansion continues.
- There are about 6,400 MW (22 TWh) announced and licensed projects where investment decisions could be made given the right conditions.
- Difficulty to reach investment decisions due to political uncertainty, increased costs, delays in grid connection decisions and postponed electrification/green transition projects.
- The trend can be reversed with:
 - measures to accelerate electrification in the industrial and transport sectors, and
 - clear messages from the government that wind power must be expanded significantly.

19 255 MW Wind Power in 2027

Projects with commissioned turbines to be built until 202.

There are also 746 MW in announced projects.

Total: 19 255 MW

Swedish Wind Power Project Portfolio

Under construction: All permits ready and turbines ordered.

Announced: Projects with permits and investors, but where investment decisions have not been made.

Permitted: Projects with an environmental permit, where the grid concession (electricity grid permit) is pending.

Under permitting review: Projects that have applied for an environmental permit to the County Council or the Government.

Consultation: The consultation procedure under the Environmental Code is underway.

"The Swedish Wind Power Project Portfolio" is a weighted assessment based on:

- Data from Swedish Wind Energy Association's member companies
- Media Reporting
- Vindbrukskollen
- Statistics on Onshore Wind Power 2014-2023 (Westander Klimat & Energi)
- Permitting Time Onshore Wind Power 2014-2023 (Westander Klimat & Energi)
- Status Report Offshore Wind Power 2024 (Westander Klimat & Energi)

98 GW offshore Wind in Various Phases

Total* 98 Gigawatts (GW) of offshore wind power under development

- Permitted (total 2 GW)
- Under permitting review (total 56 GW)
- Consulation (total 40 GW)

*In addition, there are over 39 GW in early stage

Production Forecast 2027

- The production forecasts refer to three different outcomes with varying annual growth rates.
- The range of outcomes depends on how the investment climate develops.
- Historical growth rate (2014-2023) is about 13 % annually.
- To achieve the positive outcome, the investment rate needs to increase compared to today.
- The neutral outcome is slightly lower than in the last ten years.

Wind Index July-September 2024

KVT Monthly wind index [%]

July this year offered unstable and relatively windy weather in most parts of the country. The only exception was in northern Norrland, where high pressure prevailed, resulting in a lower-than-normal average wind speed.

In August, however, the winds broke loose in earnest in connection with several low-pressure systems that passed over the country. The windiest time was at the end of the month when Storm Lilian passed by. In general, the average wind strength was 100-140 % of normal, except for the south-eastern corner of the country, which was less windy than usual.

In September, the roles were reversed compared with July, with windy weather in northern Norrland and relatively weak winds in other parts of the country. The weak winds in the south were linked to the high pressure and the heat wave that swept up over the country. In the north, on the other hand, there was more low-pressure activity and fresher winds.

Market shares, turbines, in 2027

Normal annual production

Total 2027

55 TWh (in line with the positive scenario)
19 255 MW
6 015 WTG

Installed capacity

Other turbine suppliers:

Dongfang, Windworld, Senvion, NEG Micon, WinWind, Sinovel, Kenersys, Fuhrländer, ENO Energy, Nordic, EWT, Vindsyssel, Vertical Wind, Giraffe, EC Wind etc.

- Announced

Electricity Generation Owners Q3 2024

Total, 187 TWh

- Swedish state, municipalities, regions
- Foreign state-owned companies
- "Industry" = large electricity consumers
- Private companies

Hydro Power, 68 TWh

Nuclear Power, 52 TWh

Wind Power, 49 TWh

CHP, 17 TWh

[Swedish Energy Agency – Market statistics](#) [guarantees of origin](#)

Increased Ownership Dispersion Loosens Market Concentration

- The three largest players in Sweden together owned 90 % of Sweden's electricity production in 1996. Today they own 58 % together.
- The five largest players in Sweden currently own 64 % of electricity production.
- This is due to the expansion of wind power and the decommissioning of nuclear power, where the big players previously dominated. Wind power has been expanded with several new players.

In-depth analysis

Political Uncertainty

- The proposal for financing and risk sharing of new nuclear reactors in the form of concessional government loans and a strike price of 80 öre/kWh has increased the uncertainty for investments in wind power.
- If the government goes ahead with the proposal without corresponding investments in other power generation that also needs to expand, the conditions for these will deteriorate.
 - The sustainability of both new and existing projects is compromised.
 - Profitability of new projects drops, hampering investment.
 - The profitability of existing projects is also deteriorating.

Permitting Statistics First Half of 2024

Still many consultations and new applications for new wind power

- 26 new consultations (423 WTG)
- 12 new applications for environmental permit (164 WTG)

Ten settled applications for onshore wind power (175 WTG)

- All applications were rejected or withdrawn before rejection. The municipal veto was the reason in six of the cases. 175 plants could have produced 4.2 TWh

One settled application in the territorial sea (167 WTG)

- The government rejected Långgrund because of the veto. The project could have produced 12.5 TWh

No application granted

- A total of 11 application that together could have produced 16.7 TWh

[Permitting statistics and the municipal veto, first half of 2024](#)

Municipal Decisions First Half of 2024

- **16 municipal decisions (218 WTG:s) in the first half of 2024 on onshore wind**
 - 12 vetoes (143 WTG:s) and four approvals (75 WTG:s)
 - Of the four projects approved by the municipalities, the Armed Forces stopped three
 - One project has moved forward in the permit process
 - The 12 projects (143 WTG:s) stopped by the municipalities could have produced 3.4 TWh
- **One settled offshore application**
 - The stopped project (167 WTG:s) in the territorial sea could have produced 12.5 TWh. *The government decision was made on 2024-03-21, but the municipalities' veto decision was made in the fall of 2023*
- **Overall picture.**
 - In total, the veto stopped 13 projects (310 WTG:s) that could have produced 15.9 TWh

Permitting statistics and the municipal veto, first half of 2024

Turbulent Market Conditions

- Russia's 2022 war of aggression, with subsequent market changes, created great uncertainty and increased costs for new wind power projects.
- Higher interest rates, higher turbine prices, higher prices for raw materials such as steel and cement have made it more difficult to make the project calculations work.
- A slowdown in the rate of electrification in the industrial and transport sectors means that Sweden's electricity surplus is increasing, resulting in low electricity prices.

Positive News From the Government

- In the budget bill for 2025, the government is clear that wind power, electrification and climate transition are closely linked:

“In the short term, wind power can account for the majority of additional electricity generation. It therefore plays an important role in ensuring that electrification does not lose momentum, in enabling the climate transition and in achieving the goal of net zero emissions by 2045”

(The Swedish Governments initiatives on electrification and green transition)

- The government has announced that it is introducing incentives for municipalities and a revenue-sharing model with residents, and that it intends to improve the conditions for expanding offshore wind power.
- “Kraftlyftet” is 700 million SEK in investment support to increase the capabilities of the electricity system with complementary technologies.

Political Intention and Action Needed

- The government needs to further clarify that the expansion of wind power is needed to strengthen investor confidence.
- The government needs to swiftly put measures into place to accelerate the transition of the industrial and transport sectors.
- The opposition parties also need to be clear that the incentive to municipalities must be long-term.
- The reform of municipal approval, the so-called municipal veto, needs to be implemented quickly to resolve an untenable situation in terms of legal certainty.
- The government needs to make decisions on offshore wind projects awaiting its' decisions.
- The time to connect to the grid needs to be shortened and made more transparent.

10 proposals for electrification and competitiveness

1. Applying EU rules on shorter licensing processes for electricity generation
2. Introduce a maximum one-year rule for power plant upgrading permits and simplify the review of electricity line upgrades
3. Enables applications for grid connection to be made in parallel with the environmental permit process
4. Introduce a time limit for the municipal veto on wind energy
5. Weighing the climate benefits of testing electricity generation that contributes to Sweden's electrification
6. Strengthen incentives for municipalities to approve electricity generation
7. Strengthen ties between the Armed Forces and electricity producers
8. Develop new maritime plans with expanded areas for electricity production
9. Mandate relevant authorities to contribute to the electrification of society
10. Use existing electricity grid more efficiently and enable conditional access contracts
